Journeyman Developer – CMS

Description

Looking for a role that is more than just coding? This is it. Build Labs is hiring a Journeyman level developer for our expanding CMS capability. This role is equivalent to a mid-level developer. In additional to tackling technical problems for clients, the Journeyman will support development efforts of the DevMentor, and help mentor apprentices to help develop their technical capabilities. These apprentices will be former Bootcamp graduates, so someone who can empathize and understand their experience level upon graduation would be ideal.

Responsibilities

As a Journeyman Developer, your primary role is to code. You'll be one of the key players on the team within your vertical, being able to work independently on projects when needed and help guide and assist others when able.

Qualifications

Though Build Labs is tech agnostic, we expect all developers to be versed in full stack development including:

- HTML/CSS with an attention to pixel-detail.
- .Net, Java, Ruby, Python or similar experience.
- JavaScript with experience in React, React Native, AngularJS, or similar JS frameworks.
- Database experience in SQL, Mongo, etc.
- DevOps and Cloud experience would be beneficial as well. We usually run Heroku, but clients are frequently running Azure and AWS

As a key member focused on CMS, we'll expect you to have or grow deep mastery over one or more CMS verticals, including Sitecore, Adobe's AEM, Kentico, Umbraco, WordPress, and the like.

Want a place to continue to grow as a developer and work with other amazing team members? This is it. Drop us an application, a resume, and a brief summary of your experience and a link to your portfolio or your GitHub account, and we'll chat.
